Abstract of the Invention

A system and method is provided for monitoring events of a plurality of members configured as an entity. Configurable event logging settings are set at a first member and dynamically propagated to each member of the entity to establish event logging configuration settings at each of the plurality of members. In one aspect of the invention, a system and method log different event types into a common event type data format at a plurality of members. The different event types can then be coalesced for the entire entity and returned to a requestor residing at a single location.
